

SOFTWARE ENGINEERING LAB -2 JIRA

NAME:SAMARTH M H

SRN:PES1UG24CS407

Screenshot 1 — Backlog and story points

Screenshot 2 — Sprint 1 board 5 works has been done.

Sprint 1 burndown chart

Sprint 2 burndown chart

1. Did your estimations reflect the actual effort?

The estimates were reasonably aligned with the simulated effort. Smaller stories were assigned 3 points, while payment, escrow, inspection and dispute stories were assigned 5 points because they involve more workflow, validation and uncertainty. Since this was a simulation, the comparison is qualitative rather than a measurement of real development effort.

2. Was your backlog well-prioritized?

Yes. Payment security, escrow protection, inspection, buyer sign-off and dispute protection were prioritized highly because they are central to the marketplace. Product selection was given

Medium priority because it starts the transaction but does not itself provide the core trust mechanism.

3. How did your simulated sprint align with your plan?

The sprint followed the planned order by moving selected stories from To Do to In Progress and then Done. Sprint 1 focused on purchase, escrow and inspection, while Sprint 2 handled escrow release and dispute protection.

4. What insights did the burndown chart give about your team's capacity?

The burndown showed how quickly the planned story points were completed. The simulated sprints reached zero remaining story points, indicating that the planned work was completed within the sprint. It also provides a simple way to compare planned progress with actual progress and evaluate whether future sprint scope is realistic.
